

Q. What is high level programming language?**Ans:**

A high-level programming language is a programming language designed to be easy for humans to read, understand, and write. It uses English-like words and simple syntax instead of instructions that directly deal with the computer's hardware.

Example: Python

```
name = "Apurva"  
print(name)
```

This is easy for a human to understand.

The computer, however, cannot directly execute Python. Python code is processed by the Python interpreter into instructions that the computer can execute.

Examples of high-level languages

- Python
- Java
- C++
- JavaScript
- C#
- Ruby

Main features

- Easy to learn and read
- Uses human-readable syntax
- Easier to write and maintain
- Generally portable across different systems
- Provides abstractions from hardware details

Simple answer

A high-level programming language is a programming language that uses human-readable syntax and hides most of the complex hardware-level operations, making programs easier to write, understand, and maintain.

Remember:

High-level language = Human-friendly programming language.
