**Program:**

```
a = input("Enter a value: ")
b = int(input("Enter an integer: "))
c = float(input("Enter a decimal number: "))

print("Value:", a, "Data type:", type(a))
print("Value:", b, "Data type:", type(b))
print("Value:", c, "Data type:", type(c))
```

**Output:**

```
Enter a value: Hello
Enter an integer: 25
Enter a decimal number: 10.5

Value: Hello Data type: <class 'str'>
Value: 25 Data type: <class 'int'>
Value: 10.5 Data type: <class 'float'>
```

**Explanation:**

- input() takes input from the user as a string (str).
- int() converts the input into an integer.
- float() converts the input into a decimal number.
- type() returns the data type of a value.
- print() displays the values and their data types.
