1. Python program to count the number of lines in a text file

Program:

```
[3]: file = open("demo.txt", "w")

     file.write("Hello Python\n")
     file.write("Learning File Handling\n")
     file.write("Python is easy\n")

     file.close()

[4]: file = open("demo.txt", "r")

     lines = file.readlines()

     print("Number of lines:", len(lines))

     file.close()

     Number of lines: 3
```

Explanation:

- open() – Opens the text file in read mode.
- readlines() – Reads all lines and stores them in a list.
- len() – Counts the total number of lines.
- close() – Closes the file.

2. Python program to count the number of words in a text file

Program:

```
file = open("demo.txt", "r")

data = file.read()

words = data.split()

print("Number of words:", len(words))

file.close()

Number of words: 8
```

Explanation:

- open() – Opens the file in read mode.
- read() – Reads the complete file content.
- split() – Separates the text into individual words.
- len() – Counts the total number of words.
- close() – Closes the file.

Important difference for understanding

Function	**Purpose**
read()	Reads the entire file as a string.
readline()	Reads one line at a time.
readlines()	Reads all lines into a list.
split()	Separates text into words.
len()	Counts items or characters.
